

S2 HYDRAT

HYDROFACIAL MACHINE

Moisturizing serum

Concentrated serum to professional use.

Proteins and Vitamins B3 and B6 that deeply hydrate and nourish the skin.

VITAMIN B3

Vitamin B3 or Niacin: found in foods such as milk, eggs, green vegetables or cereal grains.

Human body produces niacin through tryptophan

(an amino acid). It has antioxidant activity so it captures free radicals, so they cannot produce skin spots.

In addition, hyperpigmentation decreases by reducing the formation of pigments that form in melanocytes and are released to keratinocytes that move up to the upper epidermis.

Facial antiaging effect: reduces the yellowing of the face, wrinkles, pigmented spots, expression lines, sagging, drooping eyelids and eye bags.

HYALURONIC ACID

It is used in the hydration of the epidermis because it reconstructs the fibers that support the skin's tissues, giving it a better shape. Viscous texture is a component that forms a natural part of the skin, and it is essential to fight against aging and wrinkles due to its high moisturizing power.

In the dermis, hyaluronic acid is the main component of the extracellular matrix (ECM).

Fibroblasts are a type of cells responsible for the production of collagen and elastin in the skin.

Hyaluronic acid makes the skin soft, smooth and elastic.
